

# Filterra® Bioscape

SPECIFIER

CLIENT

Davis Ogilvie

Station Bay,  
Covington Group

 Station Bay, Lake Tekapo

Station Bay is a boutique residential subdivision just outside the Lake Tekapo township, developed by Covington Group. Stringent water quality requirements were set by ECAN for this high-profile development. The team at Davis Ogilvie, Timaru, were tasked with the stormwater management design for the 5.1-hectare the first stage of the development.

Due to the proximity of the lake, a green infrastructure solution was considered essential. Davis Ogilvie approached Stormwater360 to explore treatment options, and whether a Filterra® Bioscape would provide benefits over a conventional rain garden design. Stormwater360 worked together with all parties from design to installation to ensure the highest quality standards throughout the whole process.

#### TREATMENT SOLUTIONS UTILIZED:

165m<sup>2</sup> Filterra® Bioscape

Cascade Separator™

#### Biological treatment to remove contaminants:

- The designed Filterra® Bioscape footprint of 165m<sup>2</sup> is approximately 1/8th of the size of the conventional system required to treat the same catchment area (rain garden footprint approx. 1,280m<sup>2</sup>). Minimising the footprint allowed for an additional 3 lots to be developed, and decreased the time and costs for maintenance.
- Using pre-treatment upstream of a filtration device in a treatment train approach is considered best practice. A pre-treatment device will remove most of the coarser sediment and gross pollutants, ensuring the performance and maintenance frequencies of the filtration device are optimised. Two Cascade Separator™ devices were used to provide upstream pretreatment for the Filterra® Bioscape.
- The Cascade Separator™/Filterra® Bioscape treatment train should ensure this large development does not impact the pristine nature of Lake Tekapo.

#### ENHANCED TREATMENT PERFORMANCE
